About Us

Copley: Driving Results for Over 70 Years

Founded in 1946 in Nottingham, UK, Copley remains family owned and managed. We are recognised as the world’s leading manufacturer of inhaler test equipment, in addition to being a trusted provider of test instrumentation for other pharmaceutical dosage forms.

We continue to work closely with industry groups and leading experts to bring relevant new products to market, with all equipment backed by expert training and lifetime support.

Committed to excellence, we aim to deliver exemplary service for an outstanding customer experience.

We deliver pharmaceutical testing equipment with the necessary accuracy and reproducibility hard-wired into its design by adopting the same Quality by Design (QbD) principles that our customers rely on to control product performance. Continuous improvement is a core element of this approach and we strive to exceed the expectations of the industry, not only by enhancing equipment performance but also through unrivalled service.

These commitments are exemplified by our investment in the ISO 9001:2015 Quality Management System for which we have certification to the latest standard for all aspects of our business, including equipment design.

Copley customers benefit from:

- High quality pharmaceutical testing equipment, designed, manufactured and tested in the UK
- Product lifetime support from our friendly and experienced technical support team
- First-class training and education

Classification of Medicines

Introduction

One of the clearest taxonomic guides for the classification of pharmaceutical dosage forms is to be found in Chapter 1151 of the US Pharmacopeia (USP) entitled “Pharmaceutical Dosage Forms”.

The guide is depicted in “Figure 1. Compendial taxonomy for pharmaceutical dosage forms”, a modified version of which appears below.

This proposes a three tier system with the first tier being based on the region of the body to which the drug is to be administered, i.e. gastrointestinal (oral), mucosal membrane (rectal, vaginal, oropharyngeal, opthalmic, otic and urethral), skin surface (topical, transdermal), injection including implants (parenteral) or nasal/lungs (pulmonary).

The second tier describes the dosage form concerned, e.g. tablet, capsule, suppository, cream, ointment, transdermal patch, injection, inhaler, etc., whilst the third tier describes whether the dosage form concerned is designed for immediate, extended or delayed release.

It is the first tier classification which has been used as the basis for the Equipment Selection Guide to be found on page 7.

This lists the route of administration, the dosage form and test parameter concerned, the chapter relating to that test parameter in both European and US Pharmacopoeia (where applicable) and, in the final column, the page number in this catalogue where a description of the relevant test instrumentation can be found.

---

Organisations and their Roles

Introduction

The ultimate responsibility for the safety, quality and efficacy of medicines and medical devices lies with the various national regulatory bodies designated to safeguard public health.

In Europe, Japan and in the USA this function is performed by the European Medicines Agency (EMA), the Ministry of Health, Welfare and Labor (MHWL) and the Food and Drug Administration (FDA) respectively.

The regulatory authorities are supported in this role by the Pharmacopoeias whose job is to define the standards with which the drug formulation shall comply and the methods by which compliance will be adjudged.

In October 1999, the International Conference on Harmonisation of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH)* published a single set of global specifications covering the Test Procedures and Acceptance Criteria for new drug substances and products.

The guidance takes the form of a number of universal tests/criteria considered generally applicable to:

- a) new drug substances and
- b) new drug products

 together with a number of additional tests and acceptance criteria for specific substances and dosage forms, including solid oral drug products, liquid oral drug products and parenterals.

The additional tests for tablets (coated and uncoated) and hard capsules, for example, include:

- a) Dissolution
- b) Disintegration
- c) Hardness/Friability
- d) Uniformity of dosage units
- e) Water content and
- f) Microbial limits

The guideline on quality concerned (Q6A) was subsequently agreed and adopted by all of the parties involved, including the EMA, FDA and MHWL.

In 2002 the FDA launched a new initiative “Pharmaceutical cGMPs for the 21st Century” in which it proposed a new risk-based approach to pharmaceutical manufacturing.

This initiative gave birth to Process Analytical Technology (PAT), a framework for understanding and improving the processes involved in pharmaceutical development, manufacturing and quality control, described in FDA’s Guidance of September 2004.

PAT operates on the premise that quality cannot be tested into products, rather, it should be built-in or by design.

The goal is to ensure final product quality by understanding and controlling the processes involved in the manufacturing operation.

ICH Quality Guidelines

<table>
<thead>
<tr>
<th>ICH Quality Guidelines</th>
<th>ICH Quality Guidelines</th>

</tbody>
</table>

The Quality by Design (QbD) approach agreed and now adopted by the EMA, FDA and the Japanese MHWL in the form of the five quality related guidelines, ICH Q8 to Q12, extends this philosophy to all parts of the product life cycle from product development, transfer through to manufacturing, manufacturing and finally product end.

ICH Q8 Pharmaceutical Development describes the suggested contents of a regulatory submission based on the QbD format.

ICH Q9 details a systematic approach to quality risk management, whilst ICH Q10 describes a new quality management system based on the complete product life cycle and referred to as the Pharmaceutical Quality System.

ICH Q11 provides a Guideline to the “Development and Manufacture of Drug Substances”, including the type and extent of information to be submitted in regulatory dossiers, whilst Q12 provides a framework to facilitate the management of the entire “Pharmaceutical Product Lifecycle.”

1. REGULATORY BODIES IN THE EUROPEAN UNION, JAPAN AND THE USA

In the USA, the regulatory function is performed by the Food and Drug Administration (FDA) with technical and scientific support being provided through two centers - the Center for Drug Evaluation and Research (CDER) in respect of medicines and the Center for Devices and Radiologic Health (CDRH) in respect of medical devices e.g. inhalers.

A similar function to the FDA is provided by the Ministry of Health, Welfare and Labor (MHWL) in Japan and the European Medicines Agency (EMA), with support in the form of the Committee for Medicinal Products for Human Use (CHMP), representing the various states making up the European Union (EU).

Other prominent bodies include the Central Drugs Standard Control Organisation (CDSCO) of India, the China Food and Drug Administration (CFDA), Health Canada and Swissmedic.

2. INTERNATIONAL REGULATION AND HARMONISATION

The International Centre for Harmonisation (ICH) mentioned on Page 8 is a unique organisation consisting of representatives from the regulatory authorities in the European Union (EMA), Japan (MHWL) and the USA (FDA), and experts from the pharmaceutical industry in the three regions, in a single forum.

The purpose of the ICH is to promote greater harmonisation in the ways in which the individual regulatory bodies regulate new drugs such that the medicine reaches the patient economically and with the minimum delay whilst maintaining the standards of safety, quality and efficacy necessary to safeguard public health.

Current goals include finalisation of ICH Q13 (Continuous Manufacturing of Drugs) and ICH Q14 (Analytical Procedure Development).

Note: A similar organisation, the Global Harmonisation Task Force (GHTF), exists for medical devices.
Organisations and their Roles

3. DRUG SAFETY, QUALITY AND EFFICACY – THE PHARMACOPEIAS

The main role of the Pharmacopoeias is to define the standards with which medicines must comply and the methods by which compliance will be adjudged.

As with the regulatory groups, the leading Pharmacopoeias tend to be those of the European Union, Japan and the USA.

a) European Pharmacopoeia

This is published by the Directorate for the Quality of Medicines and Healthcare of the Council of Europe (EDQM).

In the European Pharmacopoeia (Ph.Eur.), the main information relating to a drug product is contained in the general monograph relating to the dosage form concerned (see “Monographs on Dosage Forms”). This normally gives a definition of the dosage form e.g. tablets, tablets, together with notes as to its production and, where applicable, the test procedures, storage conditions and labelling requirements relevant to that type of product, with cross references to appropriate methods of testing e.g. Uniformity of Dosage Units (2.9.40).

The EDQM is also responsible for “Pharmeuropa”, a quarterly publication which contains “Draft Monographs and General Texts for Comment” together with the latest news on “International Harmonisation”.

b) United States Pharmacopeia

Hitherto, the United States Pharmacopeia (USP) has adopted a similar approach to Ph.Eur. with details of the test procedures to be employed together with all of the other relevant information in product specific monographs with cross references to the appropriate methods of testing e.g. Uniformity of Dosage Units <905>.

A separate chapter, Pharmaceutical Dosage Forms <115>, gives a general description and definition of the more common dosage forms together with the general principles in their compounding and manufacturing.

However, in USP 38 the Pharmacopeia has introduced a series of new chapters, <1> through to <5>, entitled General Requirements for Tests and Assays, which provide general information and the critical quality attributes applicable to the various dosage forms based on their route of administration (see Table on Page 11).

The five chapters concerned detail the test procedures relevant to each dosage form, divided between those relating to product quality and those to product performance, with cross references to the methods of testing as appropriate.

Product quality tests assess physical, chemical and microbial attributes.

Product performance tests assess drug release from the dosage form concerned or, in the case of aerosols, particle size distribution.

Like Ph.Eur., USP also produces a bi-monthly publication entitled “Pharmacopeial Forum”, which contains discussion documents relating to new and/or amended chapters and monographs.

Disintegration

Background: Disintegration Testing

Before the active ingredient(s) of an oral solid dose drug product can be absorbed into the body, the tablet or capsule in which they are contained must first disintegrate into smaller particles.

Chapters Ph. Eur. 2.9.1 and USP <701> and <2040> describe reproducible and standardised methods for quantifying the disintegration behaviour of solid dosage forms.

Test Apparatus & Method

Typically, the tablets and capsules to be tested are each placed in one of six vertical tubes each measuring approx. 77.5 mm long x 21 mm inside diameter, positioned in a circular basket arrangement.

The lower end of each tube is covered by a 2 mm sieve mesh. Large tablets, capsules and boluses may require a larger basket.

The basket assembly is raised and lowered in simulated gastric fluid at body temperature (37 °C) through a distance of 55 mm, at a constant stroke frequency of 30 cycles per minute. A plastic disc of precise geometry “hammers” the tablet during the operation, thus assisting in the disintegration process.

The tablet is said to pass the test providing that no tablet residue remains on the sieve mesh after the designated time, typically 30 minutes for ordinary tablets and 60 minutes for enteric-coated tablets.

Chapters Ph. Eur. 2.9.1 and USP <701> and <2040> describe reproducible and standardised methods for quantifying the disintegration behaviour of solid dosage forms.

Disintegration: DTGi Series

Reproducible, standardised and affordable disintegration testing

The result of decades of innovation and experience in the field of pharmaceutical testing, the Copley DTGi series of disintegration testers simplifies testing within R&D and QC environments. Suitable for a wide range of tablet and capsule types (e.g. plain-coated tablets, delayed-release, gelatine etc.), the DTGi tester series is an affordable range of disintegration testers, that complies fully with specifications defined in Ph. Eur., USP and associated Pharmacopoeias.

Controlled via our intuitive touchscreen interface, the Copley DTGi Series features 1, 2, 3 and 4 station units as well as a 2-station independent control unit, ideal for testing tablets and capsules under varying conditions. The user-friendly design makes assessing disintegration characteristics a simple touch-of-a-button task.

Disintegration: DTGi Series

Disintegration: DTGi Series

DTGi Series: Key Features

Quick-release baskets for rapid sample loading, unloading and cleaning

Intuitive touchscreen control with icon-based menu structure simplifies operation and clearly displays test parameters throughout run

Robust metal case with advanced corrosion protective coating

Basket rack assemblies are automatically lowered and raised by/from test media at start and end of test

Ph. Eur. and USP compliant

Integrated, precision temperature control and measurement

Intuitive touchscreen control to simplify operation

Single-point electronic temperature calibration

Extensive data reporting output options

One to four test station unit configurations, plus independent station control unit option

Option to automate and remotely control DTGi systems

Adjustable stroke frequency control for accelerated or high sensitivity testing

Pharmaceutical Testing

Note:
A low-working noise level is generated by the equipment ensuring a comfortable working environment
DTGi Series: Touchscreen User Interface

Key Features:

- **Intuitive menu structure** enables users to locate features quickly and easily
- **Easy-set user-configurable test parameters**:
  - Speed (cycles per minute)
  - Temperature (°C)
- Report output settings menu
- **Status of ‘Actual’ v ‘Set’ test parameters clearly displayed** throughout testing
- **Test progress bar** provides clear and constant indication on run status
- **Resistive touchscreen interface can be operated with gloves on**
- **Hygienic wipe-clean screen**
- **Passcode-protected temperature calibration**
- **High productivity – easy system set-up and operation** minimises training burden.

**Reporting**

Extensive data output options are available as standard, including direct reporting to a printer or PC.

**Reported parameters**

- **Speed** (cycles per minute)
  - Set
  - Average
  - Maximum
  - Minimum
- **Temperature** (°C)
  - Set

Independent Station Control: DTG 200i-IS

With the same standard features as the other DTGi systems, the DTG 200i-IS offers independent control over each test station, making it ideal for the following types of applications:

- Comparing one formulation directly against another
- Comparing the performance of a single formulation under different conditions
- Assessing delayed release or enteric coated tablets where samples must be immersed for specified periods of time in different media
- Allowing two users to run tests simultaneously

Dissolution

Background: Dissolution Testing

Optimising the amount of a drug available to the body following administration, i.e. its bioavailability, remains one of the greatest challenges the pharmaceutical industry faces. Inadequacies in bioavailability can mean a treatment is ineffective or even potentially dangerous (e.g. overdose).

The effectiveness of tablets or capsules administered orally relies on the drug dissolving in the fluids of the gastrointestinal tract prior to absorption into the systemic circulation. It is widely acknowledged that the rate at which the drug dissolves is critical to its therapeutic efficacy and as such, is considered a Critical Quality Attribute (CQA) in both the formulation process and final quality control.

Determining bioavailability via in vivo drug release analysis studies (e.g. urine or plasma analysis) can be impractical, particularly when such techniques are required on a routine basis. To overcome such issues, official in vitro dissolution tests have been rigorously and comprehensively defined in the respective Pharmacopoeias and are essential for:

- Predicting in vivo drug bioavailability
- Assessing bioequivalence and its application in scale-up and post-approval changes
- Optimising therapeutic effectiveness during development and stability assessment
- Ensuring uniformity between production lots

Initially developed for oral dosage forms, the role of the ‘dissolution test’ has now been expanded to the ‘drug release’ of various other forms such as semisolids topical and transdermal systems (see page 74).
Dissolution

Test Apparatus & Method

The progressive optimisation of dissolution testing for different pharmaceutical forms has led to the introduction of a range of different apparatuses and techniques as detailed in Ph. Eur Chapters 2.9.3, 2.9.4 and USP Chapters <711> and <724>.

The most commonly used apparatus defined by the Pharmacopoeias to measure the dissolution rate of solid dose forms are the basket and paddle.

The basic dissolution apparatus consists of a covered cylindrical vessel with a hemispherical bottom, typically holding 1000 mL of simulated gastric juice.

The vessel is immersed in a water bath capable of maintaining the temperature of the vessel contents at 37°C. For the basket method, the tablet or capsule is constrained in a cylindrical basket, constructed of sieve mesh, of defined proportions. The basket is attached to a metal drive shaft, positioned so that the bottom of the basket is 25 mm from the bottom of the vessel.

With the paddle method, the basket is replaced by a paddle and the sample to be tested is allowed to sink to the bottom of the vessel. During a test run, a motor is used to rotate the shaft at a speed specified by the appropriate Pharmacopoeias.

The paddle over disk technique is used for the determination of the drug release rate from transdermal patches. It is described in the Ph. Eur under Chapter 2.9.4 and under Chapter <724> as Method 5 in the USP. Using a suitable adhesive, the transdermal patch is simply mounted on a disk designed to hold it at the bottom of the vessel. The rotating cylinder (Ph. Eur. Chapter 2.9.4, USP Method 6) is an alternative to the paddle over disk method.

Samples of the dissolution medium are taken at predefined time intervals to determine the percentage of dissolved drug present typically using a UV/Vis Spectrophotometer or high-pressure liquid chromatography (HPLC). Dissolution of all but the most specialised oral pharmaceutical dosage forms can be tested with either the basket or paddle methods.

Other techniques specified in the USP for dissolution testing include: Reciprocating Cylinder (Apparatus 3), Flow-Through Cell (Apparatus 4) and Reciprocating Holder (Apparatus 7). These are not routinely required except for highly specialised dosage forms.
Dissolution: DISi Series

Expertly engineered systems for everyday dissolution testing

Meeting the latest specifications as laid down in the European, United States and associated Pharmacopoeias, the DISi Series from Copley is a range of reliable and cost-efficient dissolution tester systems designed with the highest standards of solid dosage testing performance in mind.

Ideal for use in both R&D and QC environments, the DISi Series is equipped with precision ground shafts that will accept any of the baskets, paddles or rotating cylinders described in the Ph. Eur., USP and associated Pharmacopoeias.

Designed to minimise user training and reduce the burden of routine equipment maintenance, the DISi Series simplifies the dissolution testing process, without compromising on data quality.

Ph. Eur. and USP compliant

Intuitive touchscreen control to simplify operation

Six and eight test station unit configurations available

Wide speed range to accommodate broad scope of methods

Integrated, precision temperature control and measurement

Single-point electronic temperature calibration

Extensive data output options

Option to automate and remotely control DISi Systems

Pharmaceutical Testing
**DISi Series: Touchscreen User Interface**

**Key Features:**
- Intuitive menu structure enables users to locate features quickly and easily
- Easy set user-configurable test parameters:
  - Speed (revolutions per minute)
  - Temperature (°C)
  - Test duration (HH:MM:SS)
- Status of 'Actual' v 'Set' test parameters clearly displayed throughout testing
- Test progress bar provides clear and constant indication of run status
- Resistive touchscreen interface can be operated with gloves on
- Hygienic wipe-clean screen
- Passcode-protected temperature calibration process
- High productivity - easy system set-up and operation minimises training burden
- Extensive data output options are available as standard, including direct reporting to a printer or PC.
- Reported parameters:
  - Speed (revolutions per minute)
    - Set
    - Average
    - Maximum
    - Minimum
  - Temperature (°C)
    - Set
    - Average
    - Maximum
    - Minimum
  - Test Duration (HH:MM:SS)
    - Set
    - Actual
- Calibration Data
  - Calibration date
  - Temperature calibrated at (°C)

**Compliance & Maintenance**
- Certificate of compliance to Ph. Eur./USP provided as standard
- Comprehensive IQ/OQ/PQ documentation packages and toolkits available
- Passcode-protected single-point electronic temperature calibration
- Latest temperature calibration information stored and available to export/print
Choose your DISi Dissolution System

**DIS 600i**
With bench space a premium in many laboratories, the DIS 600i is one of the most compact dissolution testers available on the market today.

**DIS 800i**
Maximising visibility and access to the critical sampling area above the bath, the DIS 800i represents the very latest in tablet dissolution testing technology.

USB B (for connection with a PC) |

**Temperature Calibration**

Single-point electronic temperature calibration. Calibration of the DISi Series temperature probe is simple, through the use of an electronic calibration key and passcode-protected calibration menu designed to guide users through the process without fuss. The latest temperature probe calibration information is stored and available to print/export when convenient to the user.

**Electronic Temperature Calibration Key**
Choose your DISi System Accessories

All DISi Series are equipped with precision-ground shafts that will accept any of the baskets, paddles or rotating cylinders described in the Pharmacopoeias. Each clutch can be raised, lowered or engaged independently of the drive head, ensuring users have maximum accessibility to the vessels, whilst also making the systems suitable for staggered starts.

Each element can be supplied with a Teflon coating for additional protection against aggressive media, if required and can be laser numbered and certified upon request.

Baskets, Paddles & Rotating Cylinders

**Basket Stirring Elements (Ph. Eur. /USP Method 1)**

- **Cat. No.** 1302B
  - **Description** Set of 6 Baskets (Ph.Eur./USP Method 1)
- **Cat. No.** 1302A
  - **Description** Set of 8 Baskets (Ph.Eur./USP Method 1)
- **Cat. No.** 1302

  - **Description** Set of 6 3-Prong Plastic Sinkers

Vessels

Compliant with Ph. Eur. and USP specifications, all DISi Series vessels feature unique Easy-Centre systems ensuring perfect positioning every time. Locking the vessel into the correct position relative to the drive shaft, the fixture ensures that the vessels will not become loose or float, even when empty. UV-resistant vessels are also available for products sensitive to UV.

Easy-clean Viton® membrane-sealed low evaporation lids are included as standard with each vessel.

- **Cat. No.** 1393
  - **Description** Automatic Tablet Drop Vessel Cover (Set of 6 for DIS 600i)
- **Cat. No.** 1394
  - **Description** Automatic Tablet Drop Vessel Cover (Set of 8 for DIS 800i)
- **Cat. No.** 1355
  - **Description** Plug for Vessel Cover
Automatic Tablet Drop

Eliminate the need for time-lag correction factor calculations with the Automatic Tablet Drop system. Guaranteeing simultaneous tablet ejection at the start of the test run, synchronised sampling is simplified.

### Sampling Probes

Choose from a range of dissolution sampling probe systems, optimised for different user requirements:

1. **Manual sampling cannula**: with a Luer fitting to accept a 20 mL syringe, bent at the top to enable easy positioning within the dissolution vessel.

2. **Resident probe**: designed to be left in-situ in the dissolution vessel for the duration of the test and is height adjustable, in accordance with differing methods described in the pharmacopoeias. 3 different types are available:
   - a. For automated systems: fitted with Omnifit fittings used in conjunction with the return line inserts
   - b. For automated systems: fitted with Omnifit fittings
   - c. For manual sampling (with Luer fittings)

DISi Series: Qualification & Maintenance

DISi Series: Qualification Tools
To calibrate all other aspects of the DISi Series, our complete range of calibration and qualification tools can be used to safeguard compliance with the appropriate pharmacopoeial, regulatory guidance and Enhanced Mechanical Calibration (EMC) requirements.

Hygiene: Anti-Bacterial/Algae Treatment
The addition of 1 mL of Aqua Stabil per month will prevent the build-up of bacteria and algae in the water bath, keeping the water clear, safe and odour-free.

Special Applications

Transdermal Patch Testing
Copley offers equipment for three different methods for the determination of the rate of drug release from transdermal patches.

1. Paddle Over Disk
A modification of Method 2 (Paddle), the Paddle Over Disk technique is suitable for patches up to a maximum of 16 mm outside diameter. Using a suitable adhesive, the transdermal patch is simply mounted on the disk, release side up.

2. Rotating Cylinder
An alternative approach employs the same dissolution equipment as USP Method 1 (Ph. Eur 2.9.4 Method 3) with the basket replaced by a cylinder stirring element. In this method, the adhesive side of the transdermal patch is placed on an inert, porous cellulosic material. This is then attached to the exterior of the cylinder using a suitable adhesive. An extension piece is included in the kit for larger patches.

3. Watch Glass / Patch
A second larger version of the disk comprising a 90 mm diameter watch glass-patch-PTFE assembly is available for larger patches.

Cat. No. | Description
--- | ---
1384 | Standard disk according to USP Method 5
1384A | Watch Glass/patch/PTFE Assembly to USP Method 5
1385 | Hollister Medical Grade Adhesive (90 gm spray)
1386 | Cylinder Stirring Element including Extension (USP Method 6)
1386B | Height Gauge for Cylinder Stirring Element
1387 | Cuprophan Flat Sheets, 128 x 345mm, Pack of 10

To calibrate all other aspects of the DISi Series, our complete range of calibration and qualification tools can be used to safeguard compliance with the appropriate pharmacopoeial, regulatory guidance and Enhanced Mechanical Calibration (EMC) requirements.

For further information about the full range of Copley Qualification Services available see Page 96
Intrinsic Dissolution

Based on the same principles as the Rotating Disk apparatus as described in USP Chapter 1087, Copley offers punch and die kits, together with a hand operated press for intrinsic dissolution methods.

Small Volumes

For dosage forms with small quantities of drug, or extended release where much lower concentrations are required than that provided by the standard 1000 mL vessel, 100 mL and 200 mL conversion kits are available.

Each conversion kit comprises:

- ✓ Mini Vessel (100 mL or 200 mL)
- ✓ Mini Paddle
- ✓ Vessel Cover
- ✓ Centring Ring Assembly

Small Volume Conversion Kits

<table>
<thead>
<tr>
<th>Cat. No.</th>

<td>Conversion Kit for Small Volumes - 200 mL</td>
</tr>
</tbody>
</table>

Special Baskets

For solid dosage forms that have a tendency to block the standard 40 mesh basket, a basket with a coarser mesh is available to retain the dosage form in the basket, whilst allowing media penetration without clogging.

<table>
<thead>
<tr>
<th>Cat. No.</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1361</td>
<td>Basket only in 316 Stainless Steel (20 Mesh)</td>
</tr>
<tr>
<td>1362</td>
<td>Basket only in 316 Stainless Steel (10 Mesh)</td>
</tr>
</tbody>
</table>

Basket for Suppository Dissolution

Oil-based suppositories give unacceptable and unreproducible results, since the suppository base tends to block the filter mesh.

With the same basic basket specification as the USP standard, the special suppository basket provides the equivalent porosity to a basket of 10 mesh, allowing suppository dissolution testing to take place unimpeded.

**Friability**

**Background: Friability Testing**

Friability is the tendency for a tablet to chip, crumble or break following compression and can occur due to shock or abrasion during subsequent manufacturing steps, packaging or shipping. Normally limited to uncoated tablets and surfaces, it is a tendency that can significantly erode tablet quality.

Tablets need to be hard enough so that they do not break up in the bottle, to safeguard product stability and dose uniformity, but sufficiently friable to disintegrate in the gastrointestinal tract and release the active(s).

Chapters Ph. Eur. 2.9.7 and USP <1216> describe reproducible and standardised methods and equipment to determine the friability of a tablet.

**Test Apparatus & Method**

A standard friability drum has an inside diameter of 287 mm and a depth of 38 mm. Each drum is fitted with a curved baffle which subjects tablets to a drop of 156 mm during rotation.

The sample (normally 10 tablets) to be tested is first weighed and then placed into the drum. The drum is then rotated 100 times at a speed of 25 rpm. Any loose dust from the sample is removed and the sample re-weighed.

Friability of a sample is defined in terms of percentage (%) weight loss (loss in weight expressed as a % of the original sample weight). A maximum weight loss of no more than 1% is considered acceptable for most tablets.

Attrition caused by tablets rubbing together can also be measured using this method with a special abrasion drum.

For coated tablets, granules and spheroids, friability cannot be determined using a conventional friability tester, as the dosage form is too hard for meaningful weight loss measurements. Alternative equipment that oscillates the sample at high frequencies is available for this purpose (see Ph. Eur. 2.9.41). The abrasive forces generated by the horizontal shaking movement of the oscillating arm of this equipment allows users to easily optimise test conditions for each type of formulation with simple-to-use programmable controls.

Chapters Ph. Eur. 2.9.7 and USP <1216> describe reproducible and standardised methods and equipment to determine the friability of a tablet.
Friability: FRVi Series

Advanced friability testers for all tablet types

Providing highly reproducible and cost-efficient friability testing, the FRVi series of friability testers from Copley allow analysts to easily characterise the critical tendency of tablets to chip, crumble or break.

Based on an original design by Roche, the Copley FRVi Series friability tester is an established standard within the pharmaceutical industry. Equipped with advanced design features, ranging from convenient sample loading and unloading to an integrated friability calculator, the FRVi Series streamlines the workflow associated with routine friability testing.

FRVi Series: Key Features

- Robust metal case with advanced corrosion protective coating
- Intuitive touchscreen control with icon-based menu structure simplifies operation and clearly displays test parameters throughout run
- Intuitive touchscreen control to simplify operation
- Convenient drum emptying function
- Integrated calculation of % tablet weight loss
- Built-in 10° angling device for larger tablets
- Ph. Eur. and USP compliant
- Extensive data output options
- Small unit footprint saves previous benchtop space
- Compatible with friability and/or abrasion drum(s)
- INNOVATIVE COMPLIANT TRUSTED

Friability
FRVi Series: Touchscreen User Interface

Key Features:

- Intuitive menu structure enables users to locate features quickly and easily
- Easy-set user-configurable test parameters
  - Speed (revolutions per minute)
  - Total revolutions
  - Test duration (HH:MM:SS)
- Status of ‘Actual’ v ‘Set’ test parameters clearly displayed throughout testing
- Test progress bar provides clear and constant indication on run status
- Resistive touchscreen interface can be operated with gloves on
- Hygienic wipe-clean screen
- High productivity - easy system set-up and operation minimises training burden
- Calculation of Friability Ratio

Reporting

Extensive data output options are available as standard, including direct reporting to a printer or PC.

FRVi Series: Friability Calculator

The integrated friability calculator removes the need for manual tablet weight loss calculations, reducing the risk of analyst calculation error and improving data accuracy.

Simply inputting start and end weight allows for automatic calculation of percentage (%) friability.

Friability results together with the test report are easily output to PC and printer.

FRVi Series: Friability & Abrasion Drums

Fitted with an aperture for convenient sample loading and unloading, the FRVi Series drums automatically revolve to face the operator for easy sample loading. Upon test completion, simply tapping the ‘empty drum’ icon on the touchscreen empties the drum contents into the waiting collection tray(s), ready for weighing.

With a choice of either USP Friability and/or Abrasion drums, the versatile FRVi Series allows direct comparisons between the two parameters under identical test conditions.

Friability: Friabimat SA-400

For the hardest and most robust solid dosage forms which fall outside the scope of the conventional friability tester a higher-energy input instrument is needed to generate quantifiable changes in surface mass. The Friabimat, as described in Ph. Eur. 2.9.41, has been designed to generate the necessary abrasive forces required to define the friability characteristics of these types of dosage forms.

Not only useful for determining the friability of hard pellets and granules, the Friabimat is suitable for detecting variations in mechanical properties between different formulations and batches, making it a convenient tool for both research and development and quality control applications.

Hardness

Background: Hardness Testing

Together with friability, hardness (or breaking force) is a defining physical characteristic for a tablet. High hardness values may indicate for example, longer disintegration and dissolution times, compromising the speed of drug delivery.

On the other hand, if hardness is too low, then friability may be also high, giving rise to poor product stability and compromised dose uniformity.

By examining correlations between hardness, disintegration, dissolution and friability, a dosage form with optimum characteristics can be produced.

Chapters Ph. Eur. 2.9.8 Resistance to Crushing of Tablets and USP Chapter <1217> Tablet Breaking Force describe standardised methods for the assessment of tablet hardness.

Hardness

Test Apparatus & Method

A tablet is placed between two platens (jaws), one of which is attached to a force gauge with load cell and the other to a motor which provides the mechanical drive.

The motorised jaw drives forward pressing the tablet against the fixed jaw until the tablet breaks. The motorised jaw then retracts and the load force required to break the tablet is recorded.

The units of force normally employed to quantify breaking force are Kiloponds (Kilogram-Force) or Newtons.
Hardness: TBF 100i

**Rapid, no-fuss tablet hardness testers**

Combining the economy of a simple, easy to use hardness tester with the accuracy of microprocessor-controlled data collection, the compact TBF 100i hardness tester delivers precise tablet hardness and diameter measurements. Tablet thickness and weight can also be recorded (optional).

Offering high tablet throughput, the intuitive touchscreen user interface of the TBF 100i streamlines test set-up procedures for users, whilst the built-in data processor provides analysts with tablet breaking force statistical analyses at the touch of a button.

**TBF 100i: Key Features**

- In-built guard for safe operation
- Robust metal case with advanced corrosion protective coating
- Intuitive touchscreen control with icon-based menu structure simplifies operation and clearly displays test parameters throughout run
- In-built thermal printer for quick checks of test results and calibration data
- Convenient tablet waste drawer for dust-free tablet disposal
- Small unit footprint saves precious benchtop space
- Extensive data reporting output options
- Choice of breaking force measurement units
- Force application: constant speed
- Option: Manual or automated entry of tablet weight & thickness data
- Ph. Eur. and USP Compliant

**INNOVATIVE COMPLIANT TRUSTED**
**Reporting**

Extensive data output options are available as standard, including direct printing from the TBF 100i and direct reporting to a PC.

**Reported parameters**
- Individual Tablet Results
  - Diameter (if enabled)
  - Hardness
  - Weight (if applicable)
  - Thickness (if applicable)

- Tablet Batch Statistics
  - Batch minimum, maximum, mean and standard deviation of:
    - Diameter
    - Hardness
    - Weight
    - Thickness

- Calibration Data
  - Calibration date
  - Temperature calibrated at °C

**Compliance & Maintenance**

- Certificate of compliance to Ph. Eur./USP provided as standard
- Comprehensive IQ/OQ/PQ documentation packages and toolkits available
- Passcode-protected static calibration routine
- Optional calibration rig available
- Latest calibration information stored and available to export/print

---

**Key Features:**
- Intuitive menu structure enables users to locate features quickly and easily
- Easy-set user-configurable test parameters
  - Rate of force application (mm/min)
  - Force measurement unit (N, kp, kgf, or lbs)
  - Tablet Batch size
- Key tablet measurements clearly displayed on-screen to user
  - Tablet weight (if applicable)
  - Tablet thickness (if applicable)
  - Tablet diameter (if enabled)
  - Tablet hardness
- Batch progress displayed during batch testing run provides clear indication on throughput status
- Resistive touchscreen interface can be operated with gloves on
- Hygienic wipe-clean screen
- High productivity - easy system set-up and operation minimises training burden

---

*Optional with balance and/or thickness gauge*
Choose your TBF 100i Accessories

Tablet Weight & Thickness

With the addition of a balance and/or Mitutoyo micrometer for measuring thickness, the TBF 100i becomes a complete system for measuring the hardness, diameter, weight and thickness of tablets. This configuration is a highly efficient, cost-effective alternative to more sophisticated commercial systems for measuring these critical tablet parameters.

Alternatively, tablet weight and thickness can be entered into the TBF 100i system manually.

Hardness: TH3 Tester

Ideal for use in the production area for a quick check of compression force, the TH3 is a portable and simple-to-use tablet hardness tester.

Using a multi-turn, low-friction hand wheel to apply the load, the TH3 is available with two load ranges, which can apply up to 200 N or 500 N (TH3/200 and TH3/500 respectively). The resulting breaking force is displayed clearly on the LCD with a wide choice of data output options.

With easy calibration verification, this tester offers easy and convenient tablet hardness testing in busy production environments.

TH3: Key Highlights

- Easy calibration verification
- Choice of force measurement unit (N, g, lbs, oz)
- Clear LCD display
- Portable unit with debris collection tray
- Extensive data reporting output options
- Measures tablets < 30mm diameter

Reporting

The TH3 is provided with RS-232, Mitutoyo and analogue data output as standard. All displayed readings including breaking force in Newtons, grams, pounds or ounces, can be transmitted to external devices, including PCs and printers.

Powders

Background: Powders

A pharmaceutical powder is a dry, bulk solid composed of many very fine particles normally classified dependent on particle size between coarse and very fine (see USP Chapter <811> Powder Fineness). Whilst powders themselves are not widely employed as a dosage form in their own right, they are often used in the preparation of other forms such as tablets, capsules and inhaled products and are frequently added to other ingredients to make semisolids such as creams, ointments and pastes.

It is this widespread use of powders in the pharmaceutical industry that has led to a proliferation of test methods for measuring powder flow and density.

USP <1174> and Ph. Eur. 2.9.36 list four well-defined methods for powder testing proposed to bring some degree of test methodology standardisation:

- Flow through an orifice
- Angle of repose
- Shear cell
- Compressibility index and Hausner ratio

Powders: Flowability

Powder flow depends on several factors, some of which relate to the powder material and some to the actual manufacturing processes, its ability, for example, to flow from a container (hopper, funnel, cylinder, etc.) or its compressibility in forming a tablet. The Pharmacopoeias recommend three methods for testing powder flow.

1. Flow Through an Orifice

Measuring the ability and the time taken for a powder to flow through an orifice of known size is a useful method of quantifying powders. As the name suggests, this technique is only applicable to free-flowing powders, not cohesive materials. Methods vary but can be classified on the basis of three basic experimental variables:

(a) Type of container employed (hopper, funnel, cylinder, etc.)
(b) Size and shape of the orifice employed
(c) Method of measuring powder flow rate

2. Angle of Repose

The Angle of Repose is the angle (relative to the horizontal base) of the conical pile produced when a granular material is poured onto a horizontal surface. It is related to the density, surface area and coefficient of friction of the material concerned and indicative of flow in accordance with the values shown in the table overleaf.
Powders: Flowability

3. Shear Cell

Measures the force required to shear a circular disk through a prepared sample of bulk material.

It comprises 2 stages:

(a) Sample consolidation (bulk density measurement)  
(b) Failure inducement (shear strength)

Shear Cell methodology widely used in the pharmaceutical industry to determine the flow properties of fine-grained powders and bulk solids and how they will behave in bins, hoppers, feeders and other handling equipment.

The ability of a powder to flow through such devices is dependent on the bulk density of the material concerned and its shear strength.

Powders: Bulk and Tapped Density

The bulk density of a powder is expressed in terms of grams per mL by dividing the weight of a given “untapped” powder sample by its volume.

It is important to ensure that no settlement occurs during preparation such that the density of the powder concerned is “as poured” and therefore includes the contribution made by the volume of the interparticulate void.

Tapped Density, on the other hand, is the density attained after “tamping down”. This is normally measured using an instrument that lifts and drops a measuring cylinder or similar vessel containing the powder through a fixed distance.

The Tapped Density in grams per mL can now be calculated by dividing the sample weight by the final tapped volume.

Compressibility Index and Hausner Ratio

Measures of the ability of the powder to flow and its compressibility can now be given in the form of (a) the Hausner Ratio or (b) the Compressibility Index (see below).

- **a. Hausner Ratio**
  
  \[
  \text{Hausner Ratio} = \frac{\text{Tapped Density}}{\text{Bulk Density}}
  \]

- **b. Compressibility Index**

  \[
  \text{Compressibility Index} = \frac{\text{Tapped Density} - \text{Bulk Density}}{\text{Tapped Density}} \times 100
  \]

In a free flowing powder, inter-particulate interaction is less significant and unsettled and tapped densities will be closer in value. In poorly flowing powders, the inverse is to be expected. It follows that the closer the Hausner ratio is to 1, the better the flow. Powders with poor flow generally have a ratio of greater than 1.25.

Powders: Flowability Testers

The Flowability Tester BEP2 has been specifically designed to address the specifications in and comments raised by the Ph. Eur. and USP on Powder Flow.

The Flowability Tester BEP2 from Copley provides a range of options for testing pharmaceutical powders including three of the four methods quoted in the Pharmacopoeias – flow through an orifice, angle of repose and shear cell – in a single, cost effective unit.

BEP2 with Cylinder Attachment

Comprising a stainless-steel cylinder measuring 76 mm long x 57 mm and a capacity of 200 mL, each attachment comes complete with 20 interchangeable stainless-steel disks each with a precision drilled hole between 4 mm and 36 mm.

The cylinder attachment can be used in two different ways:

i. For quantitative flowability tests based on mass vs time

ii. To determine the intrinsic flowability of a powder via a flowability index based on comparative measurements.

BEP2 with Funnel Attachment

The stainless-steel flow funnel is designed to simulate flow in a hopper or other similar production situation.

Supplied with 10 mm, 15 mm and 25 mm aperture quick-change nozzles it is manufactured from pharmaceutical grade 316 stainless steel. Testing is carried out with an easy-to-use shutter.

Remove the hassle of a stopwatch by adding our balance and timer attachment to the shutter mechanism to simplify and streamline mass vs time tests including:

a) Flow time of a predetermined sample weight
b) Flow time of a predetermined sample volume
c) Weight of a sample in a predetermined time
d) Time against sample weight (weight/time).

BEP2 with Funnel and Shear Cell Attachments

The Copley cylindrical shear cell attachment is ideal for determining flow properties based on the bulk density and shear strength of fine-grained powders and bulk solids.

Providing important information on a given material’s behaviour in bins, hoppers, feeders and other handling equipment, the Copley shear cell enables precise control of test parameters for a wide range of flowability measurements.

BEP2 with Funnel and Angle of Repose Attachments

Providing a simple method for assessing the friction characteristics of powders, the Copley angle of repose attachment is ideal for predicting manufacturing issues associated with resistance to movement between particles.

Comprises a 100 mm diameter circular test platform together with a digital gauge. Powder heights of up to 300mm can be easily read from the clear gauge display. Dividing this value by 50 calculates the angle of repose.
The bulk density of powders can be extremely difficult to measure since the slightest disturbance may result in a change in the results. This is the result of the relationship between the particles that constitute the powder bulk. This same relationship affects the ability of the powder to flow. The Scott Volumeter obviates this problem.

### Powders: Bulk Density Tester

The Bulk Density Tester (Scott Volumeter) is described in Ph. Eur. and USP and is designed for measuring the bulk density of fine powders and similar products.

The bulk density of powders can be extremely difficult to measure since the slightest disturbance may result in a change in the results. This is the result of the relationship between the particles that constitute the powder bulk. This same relationship affects the ability of the powder to flow. The Scott Volumeter obviates this problem.

Powders: Tapped Density Testers

A high reliability solution for routine measurement of the tapped density of powders, granules and similar products, the Copley JVi testers are the only single tapped density systems on the market that offer all three methods specified in Eur. Ph. and USP.

Available with either one or two test stations, the JVi tapped density series provides detailed reports, including Hausner ratio calculations for a wide range of industrial standards.

**JVi Series: Key Features**

- Ph. Eur. and USP Compliant
- Intuitive touchscreen control to simplify operation
- Supports Methods 1, 2 and 3
- Integrated calculation of bulk density, tapped density, Hausner ratio and compressibility index
- Adjustable stroke frequency control for accelerated or high sensitivity testing
- One to two test station unit configurations
- Extensive data reporting output options
- Option to automate and remotely control JVi systems
- Various cylinder sizes available
- Small footprint saves precious benchtop space
- Robust metal case with advanced corrosion protective coating
- Intuitive touchscreen control with icon-based menu structure simplifies operation and clearly displays test parameters throughout run
- Supports Methods 1, 2 and 3

**INNOVATIVE COMPLIANT TRUSTED**

Semisolids

Background: Semisolids Testing

Most pharmaceutical dosage forms applied directly to the skin for topical action are classified as semisolid, a group of products which include ointments, creams and gels. They are typically applied for immediate, localised relief.

These products are typically hydrocarbon-based or oil-in-water emulsions incorporating additional ingredients such as emulsifiers, stabilisers, pH buffers, preservatives, absorption promoters and perfumes.

USP Chapter <1724> details the performance testing required for semisolid drug products.

Semisolids

Test Apparatus & Method

There are three different apparatuses for the in vitro determination of drug release from semisolid drug dosage forms:

- Vertical Diffusion Cell (VDC)
- Immersion Cell
- Flow Through Cell (Apparatus 4)

Due to its simplicity and reproducibility, the VDC, or Franz Cell, is typically the apparatus of choice.

The VDC comprises two parts: (a) the donor chamber containing the sample to be tested and (b) the receptor chamber containing the receptor medium.

The two parts are separated by an inert, highly permeable support membrane that acts as a conduit through which diffusion occurs.

The receptor chamber temperature is usually set to 32°C to simulate normal skin conditions. At least 6 samples should be taken over a 6-hour period and analysed using HPLC or a similar analytical technique.

Results are calculated and expressed as the amount of drug released per unit membrane area (mcg/cm²) vs square root of time. This should yield a straight line. The slope of the line (regression) represents the release rate of the product.

Annex 1 of the EMA ‘Guideline on quality of transdermal patches’ suggests the use of the VDC for permeation studies on transdermal patches.
**Vertical Diffusion Cell System: HDT 1000**

**Simple, reproducible semisolid drug release measurement**

With precision heating and integrated powerful magnetic stirrers, Copley’s compact HDT 1000 test system offers full control over all test parameters and has become the benchmark vertical diffusion cell test system for many labs.

Using an innovative heating block approach, the HDT 1000 eradicates the difficulties and the “spaghetti” of tubing associated with water-jacketed cell systems and accommodates either endpoint, discrete manual or fully automatic sampling techniques. A dedicated stirrer mounted beneath each station ensures thorough mixing throughout testing for accurate sampling.

- **USP compliant**
- **Precision control over all test parameters**
- **Powerful magnetic stirrers ensure consistent mixing during testing**
- **Novel cell clamps simplify cell preparation and sample collection**
- **Innovative dry heating system simplifies test set-up**
- **Insulation to help maintain temperature stability**
- **Small unit footprint saves precious benchtop space**
- **Innovative heating block eradicates use of water-jacketed cells**
- **Easy to access sampling ports**
- **Up to 10 cells accommodated per test run**
- **Control is provided via a user-friendly membrane keypad with test parameters displayed clearly on a backlit LCD screen**

**Cells**
All cells supplied with Copley's Vertical Diffusion Cell systems are designed to simplify cell preparation and sample collection procedures.

For USP Models 'A', 'B' and 'C', vertical diffusion cells are supplied complete with individual cell tops for both 'closed or occluded' operation (as per Model 'A') and 'open' operation (as per Models 'B' and 'C' respectively), maximising the versatility of the HDT series.

To accommodate 'full thickness' membranes or skin, and in contrast to the Type 'B' and 'C' cells, which use a 3-pronged spring clip, a screw-type cell closure mechanism has been developed for the skin specific cell that ensures proper contact between the sample and the receptor medium. All components of the cell are made from FDA-approved inert materials and a side sampling arm facilitates easy filling, sample withdrawal and media replacement.

Samples are separated from the receptor media by a synthetic inert and highly permeable support membrane.

Membranes

Copley offers a range of three synthetic membranes:

- **PVDF**
  A hydrophilic polymeric membrane
  Pore size: 0.45 microns.

- **Supor Polyethersulfone**
  A hydrophilic polyethersulfone membrane with a 0.45 m pore size. These membranes have reduced protein binding and fewer leachables than Tuffryn membranes.

- **Strat-M Membranes**
  Newer, multi-layered membrane offering higher correlation to human skin than simpler synthetic alternatives, without the high test variability associated with biological models and does not require wetting.

VDC HDT 1

A simple test system for a single diffusion cell.
This is a smaller alternative to the main HDT 1000, ideal for entry-level semisolids testing.
Degassing

The Vacuum Deaeration Apparatus Model (VDA) from Copley is an easy-to-use and inexpensive unit designed to degas receptor medium prior to its use, ensuring that diffusion is unimpeded by the collection of gas beneath the membrane. Once deaerated, the system can be used to maintain the temperature of the degassed dissolution medium to the required temperature for testing.

Used in combination with a vacuum pump, pressure meter and dissolved oxygen meter, the VDA system guarantees oxygen levels below 4 ppm, exceeding the recommendations set out in the pharmacopoeias (USP suggests an oxygen concentration <6 ppm is an adequate level of dissolution media deaeration).

Accommodating a 25 mm diameter membrane, the Immersion Cell is comprised of 4 main parts:

1. A retaining ring to secure the membrane to the cell body
2. A washer to hold the membrane in contact with the sample
3. The membrane or skin
4. The cell body which contains the compartment in which the sample to be tested is placed

The immersion cell is used with a special flat-bottomed version of the 200 mL Small Volume Conversion Kit (see Page 38) to eradicate the issue of dead space under the cell that would occur with a round bottomed vessel.

The VDA system comprises of:

- 500 mL pressure bottle containing receptor medium
- Water bath to heat the contents of the bottle to 45°C
- A magnetic stirrer/heater to stir the content of the bottle whilst heating it and the surrounding water bath
- A condensate filter to prevent condensate from damaging the vacuum pump

The following items are required in addition to provide a full system:

- A vacuum pump
- A differential pressure meter to display pressure and test for leaks
- A dissolved oxygen meter to measure and display dissolved oxygen levels in the media

### Immersion Cell

An alternative to the Vertical Diffusion or Franz Cell for testing semisolids, the Immersion Cell (USP Model A) is described with the conventional USP Apparatus 2 for Dissolution testing on Page 75.

Accommodating a 25 mm diameter membrane, the Immersion Cell is comprised of 4 main parts:

1. A retaining ring to secure the membrane to the cell body
2. A washer to hold the membrane in contact with the sample
3. The membrane or skin
4. The cell body which contains the compartment in which the sample to be tested is placed

The immersion cell is used with a special flat-bottomed version of the 200 mL Small Volume Conversion Kit (see Page 38) to eradicate the issue of dead space under the cell that would occur with a round bottomed vessel.

Suppositories

Background: Suppository Testing

Suppositories, which advantageously avoid the risk of digestion of the active drug in the gastrointestinal tract, are classified as either:

Hydrophilic: made from a water-soluble base such as polyethylene glycol, which dissolves in rectal or vaginal fluids.

Lipophilic: made from a greasy base such as cocoa butter, which melts at body temperature.

There is no single method of drug release testing suitable for all types of suppository formulations.

Suppository Testing

Test Apparatus & Method

The suppository is a more common and accepted dosage form in Europe than in the USA which may explain why references to specific test methods relating to suppositories and associated dosage forms are mainly confined to the European Pharmacopoeia.

The rate of drug release (dissolution) for hydrophilic suppositories can be measured using the standard basket, paddle or flow through methods described in USP Chapter <711> and Ph. Eur. 2.9.3 (see Page 24-25). Methods for lipophilic suppositories include:

- a modified basket method (see Page 39)
- a paddle method (see Page 24)
- a modified flow method (see Ph. Eur. 2.9.42)

In addition to this, the European Pharmacopoeia references two other technical procedures relating to disintegration and softening time of suppositories:

2.9.2 Disintegration of suppositories and pessaries
2.9.22 Softening time determination of lipophilic suppositories
Suppository Tester: SDT 1000

Straightforward suppository testing

Designed in accordance with the specifications laid down in Ph. Eur. 2.9.2, the SDT 1000 is a single unit tester optimised for assessing the disintegration properties of suppositories and pessaries and with the appropriate attachment, for measuring the softening time of lipophilic suppositories (as per Ph. Eur. 2.9.22.-2).

The SDT 1000 has a simple design, which uses manual inversion controlled via a water-resistant pulley system. Test parameters including water bath temperature and stirrer speed are easily set using the touch key interfaces.

SDT 1000: Key Features

- Manual sample inversion offers users ultimate control and flexibility
- Integrated PT100 probe for precision temperature control and measurement
- Powerful magnetic stirrer ensures consistent mixing during testing
- Independent digital heater/circulator maintains a constant temperature and minimises vibration
- Easy-remove components for straightforward cleaning
- Small unit footprint saves previous benchtop space
- Single unit assesses both disintegration and softening time (with necessary attachments)
- Ph. Eur. compliant
Softening Time Attachment

A special attachment is used in place of the disintegration test station, in combination with a 4-litre beaker containing three glass rods (C1) for measuring the softening time of lipophilic suppositories, in accordance with Ph. Eur. 2.9.22-2.

Vaginal Tablet Tester (VTT)

Using the same sample holder as the SDT 1000 together with a low form beaker and heater/stirrer, Copley’s VTT is a reliable, easy-to-use and compliant (Ph. Eur. 2.9.2) solution for assessing the disintegration properties of vaginal tablets.

Thickness

Background: Thickness Testing
The thickness of a tablet is critical to its therapeutic efficacy since thickness impacts on disintegration and dissolution behaviour.

In addition, thickness can be a useful indicator of the consistency, or otherwise, of tablet weight which is controlled to ensure dose uniformity.

The weight of a compressed tablet is dependent on three factors:

Density Diameter Thickness

Test Apparatus & Method
Though a modern tablet press should provide a good level of uniformity, there are several potential sources of variation, the most important of which is powder flow which can affect the uniformity with which the die is filled before compaction.

Mechanical wear and imperfections in the pressing or tooling may also introduce variability, as can the build-up of material on the punch face or die wall during a run. Any of these factors may impact tablet weight and the physical consistency of manufactured tablets.

Monitoring tablet thickness at regular intervals allows potential problems relating to tablet weight and hence content uniformity to be detected and efficiently diagnosed at an early stage.
Calipers & Thickness Testers

Easy-to-operate and portable tablet thickness testers for busy production environments

Copley’s range of calipers and thickness testers are simple and easy-to-use instruments, designed for use by the press operator on the compression floor.

Digital Caliper Model 500
Accepting tablets and similar samples up to a maximum size of 150mm, the inexpensive Digital Caliper 500 is a convenient, hand-held electronic caliper, for quick, simple and convenient tablet thickness testing. Supplied in a handy plastic storage case, the Digital Caliper 500 can be readily connected to data processor units for statistical process control.

Tablet Thickness Tester 700
A dedicated pocket-sized unit for simple, one-handed operation. Just switch the device on, zero the gauge, select the units, insert the sample, release the jaw and read off the measurement on the clear LCD display.

Tablet Thickness Tester 547
A more sophisticated unit than the Tablet Thickness Tester 700, this gauge enjoys many of the same features but can be used in two different modes:
1. ‘Direct measurement’ mode which provides actual thickness
2. ‘Comparator measurement’ mode whereby a +/- variance from a pre-set norm is indicated on the display. This is extremely useful for rapid checks in the production environment.

The Digimatic Mini Processor Model 264
A powerful compact data processor which provides a wide variety of calculations for generating X-R control charts, histograms and data displacement charts.

Services

Copley offers a comprehensive range of services from bespoke product design to installation, expert training and technical support, optimising all aspects of pharmaceutical testing from start to finish.

Design

Our design and development teams have many years’ experience working closely with the pharmaceutical industry in helping to develop their ideas for solving problems. Whether you have a longstanding problem, one that has been created by the introduction of a new process, or an idea for a new product, or even a bespoke design that you need manufacturing, we would be delighted to hear from you.
We recognise the regulatory importance of proper Installation Qualification (IQ), Operational Qualification (OQ) and Performance Qualification (PQ). For this reason, full supporting IQ/OQ/PQ documentation is available for a wide selection of our products, to guide users through the qualification process.

Our team of highly skilled engineers and technicians are fully trained to deliver calibration and qualification (IQ/OQ) services for the complete range of Copley products, in compliance with GxP procedures. Please contact us to find out more about our range of servicing options.

We understand how important it is that your equipment operates consistently throughout every test run, every day of the week. With the Copley range of pharmaceutical testing equipment you’re opting not only opting for exemplary performance, but also quality, reliability and compliance. To keep your instruments operating in peak condition and to ensure they are properly calibrated, Copley offers a range of comprehensive servicing options giving owners peace of mind.

We offer a broad range of both in-house and on-site service packages tailored to customers’ specific needs. All our servicing packages follow well documented maintenance and calibration procedures.

Copley training courses are interactive, lecture and exercise-based courses provided by experts in the field who can share their in-depth knowledge of evolving technologies and regulatory landscapes.

Our range of courses can be tailored to the needs of the user, from novice to experienced analyst, covering a narrow or broad range of subjects and can be conducted on-site or at our purpose-built training facility in Nottingham, UK. Training certificates are also supplied for users’ training records.

Specially qualified trainers are able to put together bespoke packages for small or large groups, with typical training programs on topics including:

- Dosage technology, test equipment, regulatory requirements, monographs and methodology, new industry developments, etc.
- Audit of current system set-up and procedures (on-site training only)
- Training of users in operation of the equipment supplied
- Troubleshooting, questions and answers

Please contact us to find out more about our range of training packages.

Buy with confidence from Copley. When you purchase equipment from us, you not only get outstanding instrumentation but also a complete customer care package which extends from the start of the sales process through to installation, training, after-sales support and beyond. With a global network of experienced and knowledgeable distributors you can rest assured that, wherever you may be, there is support every step of the way.
